

Improve your probability of success with non-GLP ecotoxicology screening

A robust non-GLP ecotoxicology study can help you determine the feasibility of advancing your R&D candidate molecules whilst significantly reducing the likelihood of setbacks later in the registration process.

Understanding the importance of safety assessment is crucial when selecting molecules for candidate selection. Unexpected issues can cause delays and disrupt programs, so it is important to identify and de-risk the best candidates early on.

Non-GLP studies can produce reliable, high-quality, and thoroughly reviewed data so registrants can make informed decisions about which candidates should continue to receive investment.

We offer adaptable design/species options to help you tailor your screening program to focus on the hazard endpoints most likely to impact your R&D activities.

Our team of experts are ready to help.
